Re: CCBWQA Watershed Model – Reservoir Direct Flow Areas

In preparation of the watershed model, the WQCD recommended that the Authority improve the accounting of flows and phosphorus loads entering the Reservoir from various components. One of the components identified were the Reservoir direct flow areas (DFA), which are defined as tributary sub-basins that are not monitored for flow and phosphorus loads. A map of the DFA boundaries and names is attached to this memorandum and listed in the table below.

The purpose of this memorandum is to provide DFA information required for the watershed model such that DFA flows and loads can be calculated in the model using the approved algorithms for surface runoff. This information includes the subbasin areas and percent imperviousness, which are provided on the attached map. This information should be included in the watershed model as a direct input to the Reservoir, as hydraulic routing is not required.

Analysis

To identify the boundaries of the DFA, the following information was used:

- UDFCD December 1990. *Drainage Basin Description Maps*. These maps provided the boundaries between major drainageways, such as between Goldsmith Gulch and DFA to the Reservoir along the west side.
- Greenhorne & O'Mara, Inc. 1989. *Stream Stabilization and Major Crossing Planning Piney Creek & Tributaries*. This report provided the boundary for Piney Creek.
- Boyle Engineering Corporation 1985. *Outfall Systems Planning Quincy Drainage & Shop Creek.* This report provided the boundary for Quincy Drain and Shop Creek.

• USGS Topographic Maps. All remaining boundaries were determined using USGS Quadrangle Topographic Maps.

Areas were calculated by using the USGS topographic base, which were scaled up, and a CAD program. To identify land use, GoogleEarthTM was used. Land use imperviousness values were estimated based on the following:

- Residential = 48%, based on previous memorandum on land use¹.
- Open Space = 5% (ibid)
- High Density Residential = 80% based on UDFCD², Table RO-3 for apartments
- Commercial = 85%, based on UDFCD Table RO-3 for neighborhood business

The resulting DFA, their watershed areas and imperviousness values are provided in the table below:

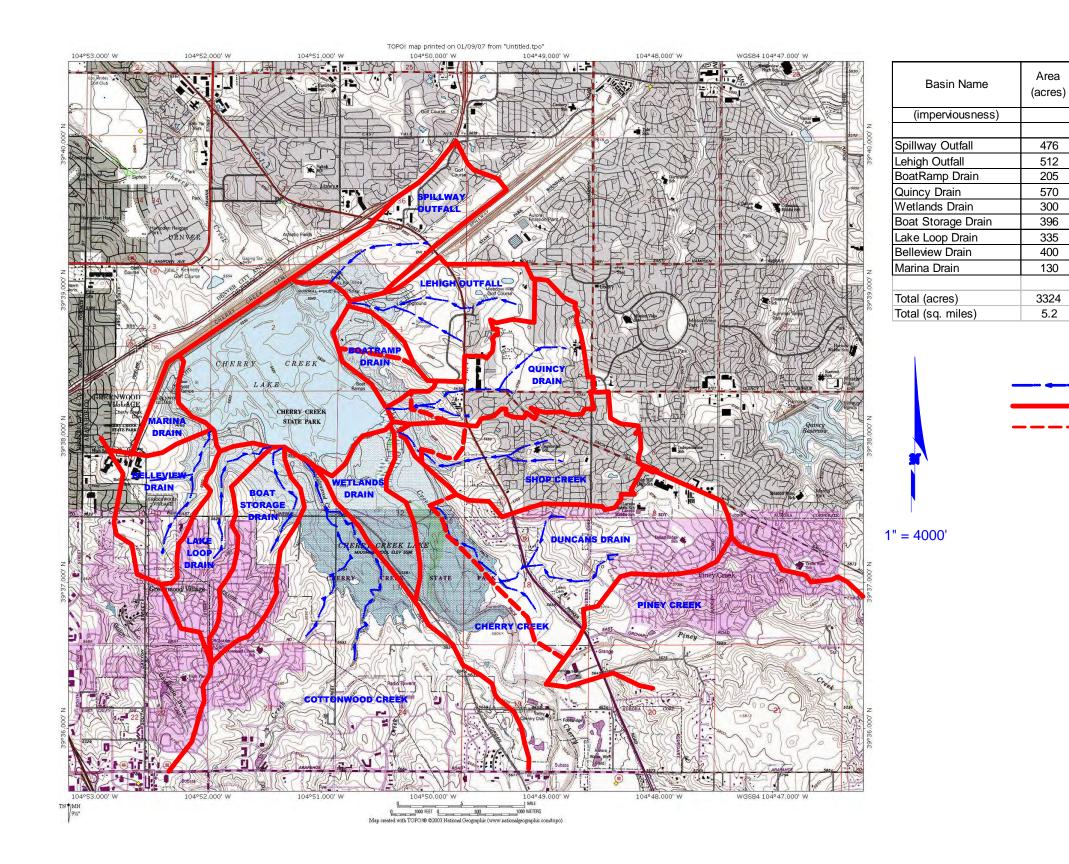

| | Area (acres) | Land Use | | | | Basin |
|--------------------|-----------------|-------------|-----------------------------|------------|------------|----------------|
| Basin Name | | Residential | High Density Residential | Commercial | Open Space | Imperviousness |
| (imperviousness) | | 48 | 80 | 85 | 5 | (%) |
| | | | | | | |
| Spillway Outfall | 476 | 0 | 93 | 50 | 333 | 28 |
| Lehigh Outfall | 512 | 0 | 60 | 7 | 445 | 15 |
| BoatRamp Drain | 205 | 0 | 0 | 0 | 205 | 5 |
| Quincy Drain | 570 | 0 | 157 | 80 | 333 | 37 |
| Wetlands Drain | 300 | 0 | 0 | 0 | 300 | 5 |
| Boat Storage Drain | 396 | 190 | 0 | 0 | 206 | 26 |
| Lake Loop Drain | 335 | 215 | 0 | 0 | 120 | 33 |
| Belleview Drain | 400 | 200 | 0 | 55 | 145 | 38 |
| Marina Drain | 130 | 0 | 0 | 13 | 117 | 13 |
| | | | | | | |
| Total (acres) | 3324 | 605 | 310 | 205 | 2204 | 25 |
| Total (sq. miles) | 5.2 | | | | | |

It is also noted that loads for Belleview Drain and Quincy Drain were previously monitored and reported in the Authority's annual monitoring report, which have been discontinued. Since both of these watersheds have detention ponds before discharging to the Reservoir, the modeling subcommittee should determine if and how these watersheds are included in the watershed model.
